

Benjamin Bowser - Bowserbl

Much of the program works. All the constructors are functioning as intended. The add and subtract methods work for the most part, but they run into issues when the original numbers are positive, and the resulting answer is a negative number. This can be seen with additionTest11 and subtractionTest5. Both result in the correct numbers, but they do not have the correct sign (negative or positive). Other than this issue, I have tested all the other issues that I had previously with the code using the JUnit tests. Many of the tests that I have included that passed, failed in the past, which generally test two extremes. I tested my other methods like min/max, compareTo, and signum just to name a few, and found that all of them were working as intended in the BigInteger class.

I have added comments on all my methods (except getters) and have included the doc folder with HTML JavaDoc inside of my project folder.
